

# Data Madness

*Martin Gassner, Henry Mauranen, Matteo Maggiolo*

*17 March 2018*

## Introduction

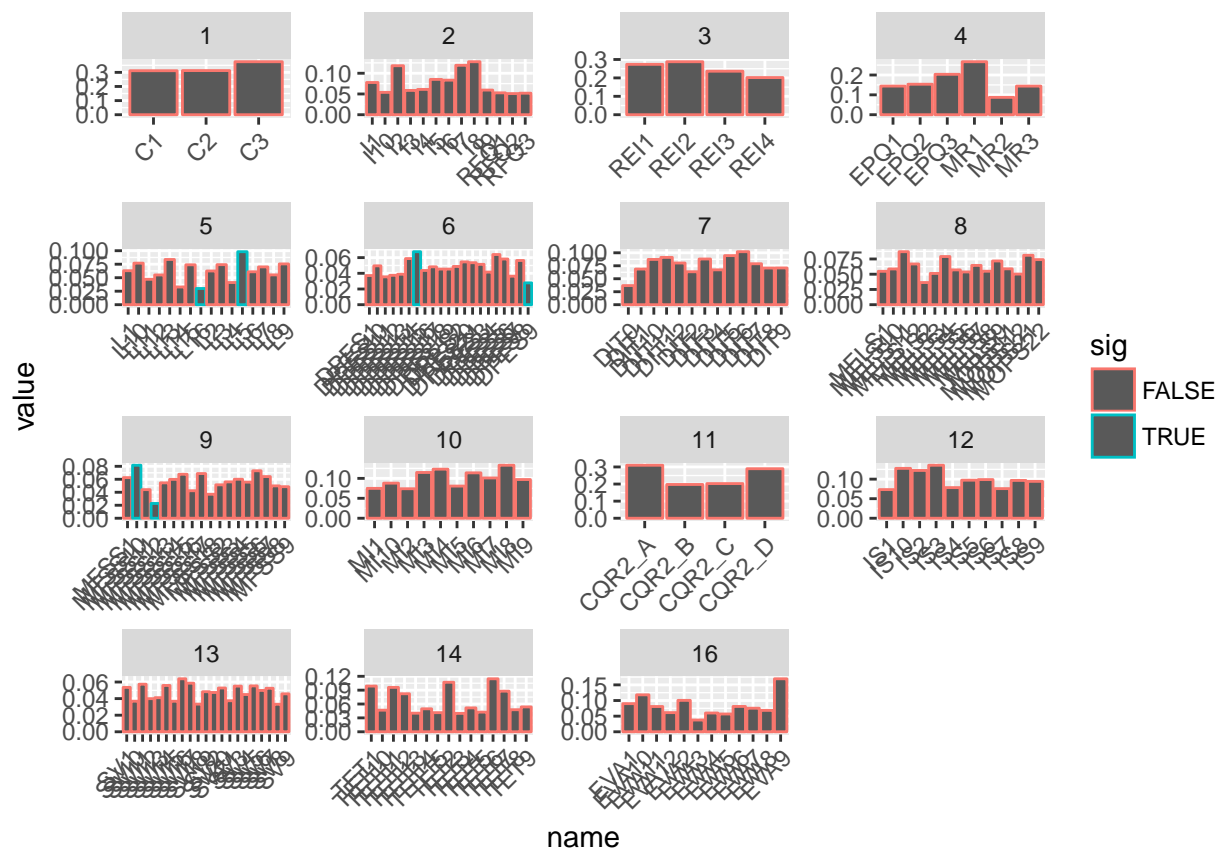

To obtain a weighting for each block of questions

1. obtain the principal components for each block
2. keep the ones explaining 85% of the variance
3. for each variable: sum the loadings of the most important principal components, weighted by the variance explained.

Additionally we tested the weights for significance within each block.

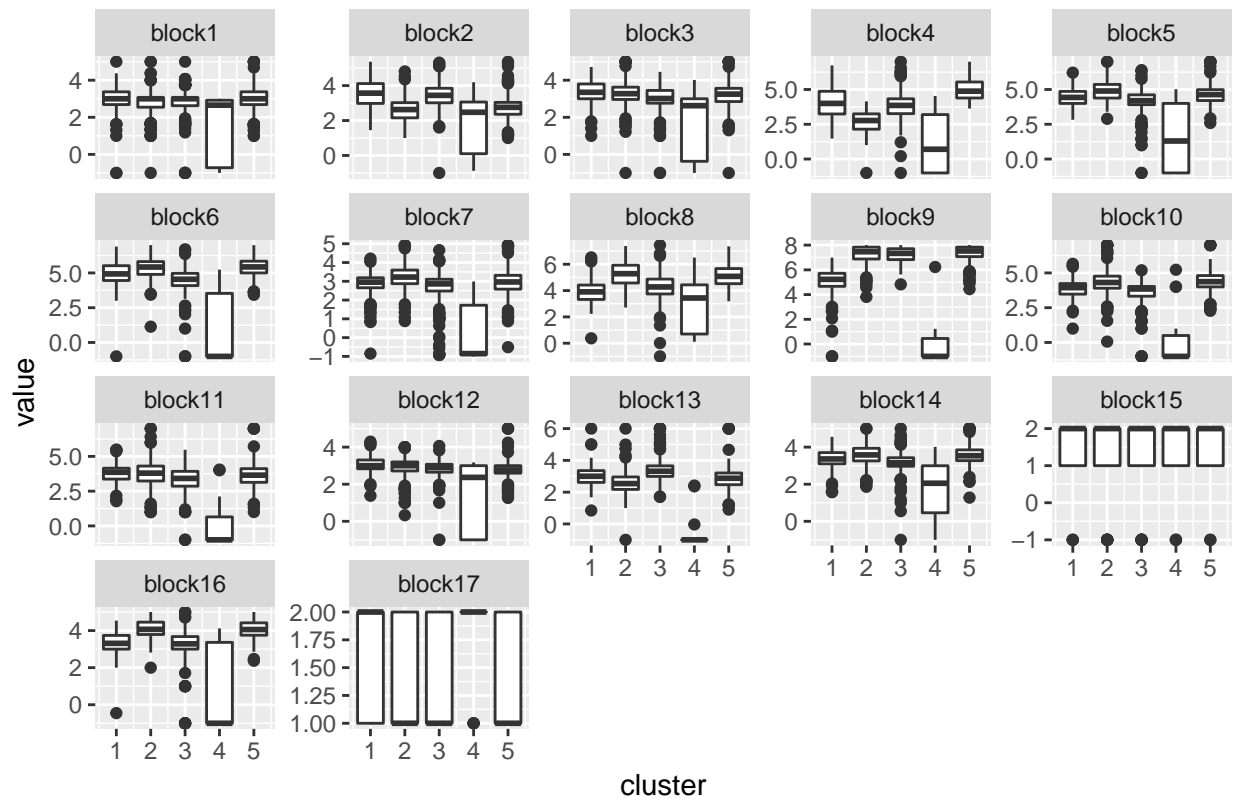

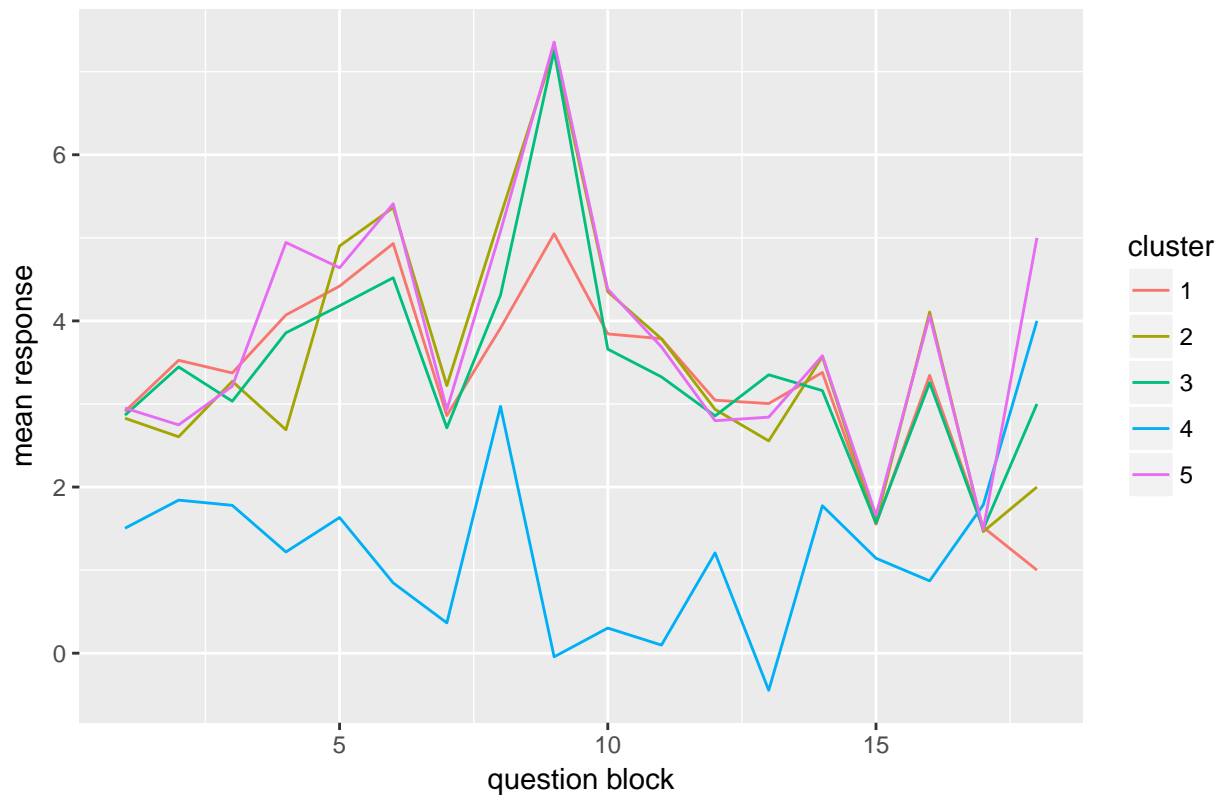

**difference per cluster size**

## distribution of responses

## Overview of mean responses

big differences Block 2: Identity measures - clusters 2,5 (less important) vs. 1,3 (very important)

highly weighted: job, political party, favorite sports team

Block 4: Moral relativism - cluster 2 (relative) vs 5 (disagreeing)

highly weighted: What is right and wrong is up to each person to decide

Block 9: Sacredness of moral principles - cluster 1 (less) vs 2,3,5 (more)

highly weighted: Sign a piece of paper that says "I hereby sell my soul, after my death, to whoever has this piece of paper" (SIGNIFICANT)

low weighted: Attend a performance art piece in which all participants (including you) have to act like animals for 30 minutes, including crawling around naked and urinating on stage

Block 17: all different; rank 1, 2, 3, 4, 5

```

Cluster 1

- find many things (country, religion etc) relevant to their identity
- do not hold moral values high/more pragmatic
- give the least in the dictator game

Cluster 2

- find less things relevant to their identity
- moral relativists
- do think of their moral values sacred/would take a lot of money
- second to last in dictator game

Cluster 3

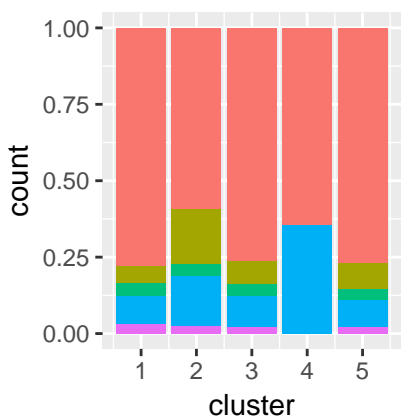

- average, really everywhere

Cluster 4

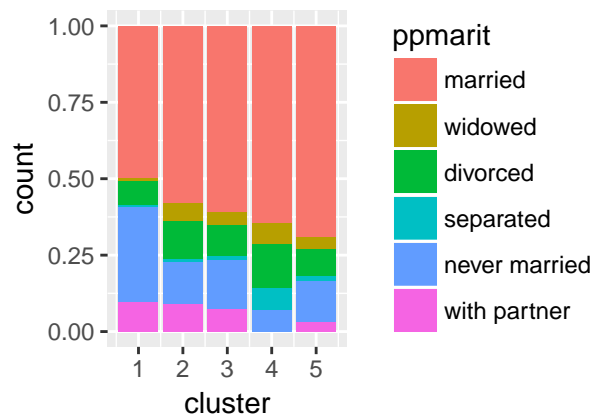

- irrelevant, too small, collects refused answers

Cluster 5

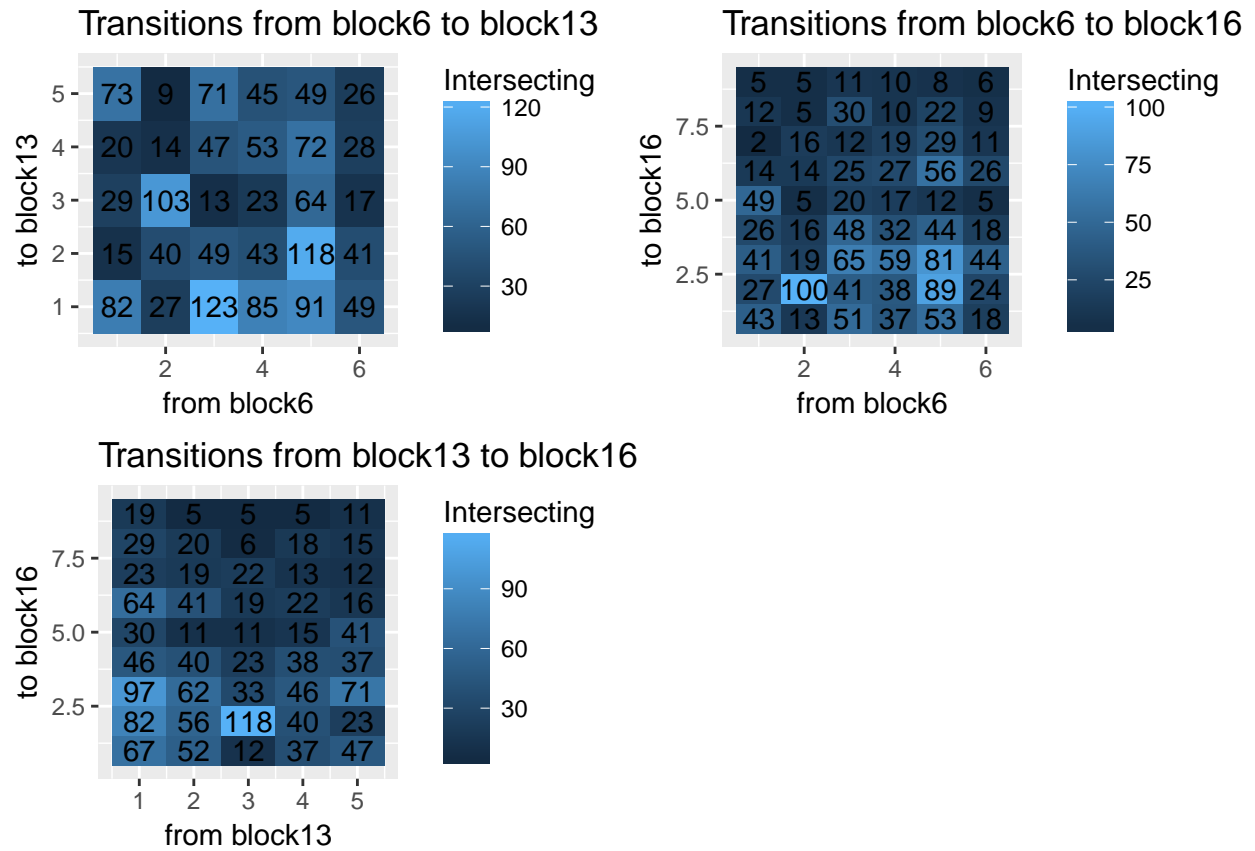

- find less things relevant to their identity
- oppose moral relativism
- do hold their morals dear
- give the most in the dictator game (exactly average)
